Answers of Test 1

1 1 (c) 2 (a) 3 (c)

2 $\frac{x^{-2} \times x^{7}}{x^{3}} = \frac{x^{-2+7}}{x^{3}} = \frac{x^{5}}{x^{3}} = x^{5-3} = x^{2}$

The numerical value of the result $= 2^{2} = 4$

Answers of Test 2

1 1 (c) 2 (c) 3 (b)

2 $\frac{3^{-2} \times 3^{7}}{3^{-3} \times 3^{6}} = \frac{3^{-2+7}}{3^{-3+6}} = \frac{3^{5}}{3^{3}} = 3^{5-3} = 3^{2} = 9$

Answers of Test 3

1 1 (c) 2 (a) 3 (d)

2 $4x^{2} + 27y^{3} = 4 \times \left(-\frac{1}{2}\right)^{2} + 27 \times \left(\frac{2}{3}\right)^{3} = 4 \times \frac{1}{4} + 27 \times \frac{8}{27} = 1 + 8 = 9$

Answers of Test 4

1 1 (b) 2 (d) 3 (b)

2 $\frac{(-4a^{3}b^{4})^{2}}{(-2ab^{2})^{4}} = \frac{(-4)^{2} \times a^{3\times2} \times b^{4\times2}}{(-2)^{4} \times a^{4} \times b^{2\times4}} = \frac{16a^{6}b^{8}}{16a^{4}b^{8}} = a^{6-4} = a^{2}$

The numerical value of result $= 2^{2} = 4$

Answers of Test 5

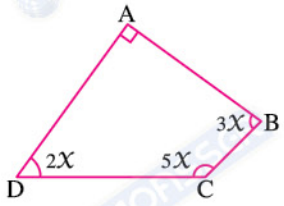
1 1 (b) 2 (d) 3 (d)

2 $\frac{(10)^{4} \times (10^{-3})^{2}}{(10)^{-3}} = \frac{(10)^{4} \times (10)^{-6}}{(10)^{-3}} = (10)^{4-6+3} = 10$

Answers of Test 1

1 1 (b) 2 (c) 3 (d)

2 ∵ The sum of the measures of the interior angles of the quadrilateral ABCD = 360°



∴ $3x + 5x + 2x + 90° = 360°$

∴ $10x + 90° = 360°$

∴ $10x = 360° - 90° = 270°$

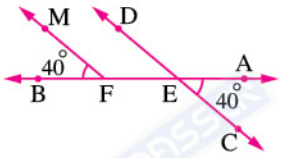
∴ $x = \frac{270°}{10} = 27°$ (The req.)

Answers of Test 2

1 1 (b) 2 (b) 3 (c)

2 ∵ $\overleftrightarrow{AB} \cap \overleftrightarrow{CD} = \{E\}$

∴ m (∠ DEF) = m (∠ AEC) = 40° (V.O.A.) (First req.)



∴ m (∠ DEF) = m (∠ MFB) = 40°

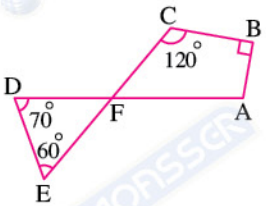
and they are two corresponding angles.

∴ $\overleftrightarrow{DC} // \overleftrightarrow{FM}$ (Second req.)

Answers of Test 3

1 1 (d) 2 (b) 3 (d)

2 In Δ DEF :



∵ m (∠ DEF) = 180° – (70° + 60°) = 50°

∴ $\overline{AD} \cap \overline{CE} = \{F\}$

∴ m (∠ AFC) = m (∠ DFE) = 50° (V.O.A.)

, ∵ the sum of the measures of the interior angles of the quadrilateral ABCF = 360°

∴ m (∠ A) = 360° – (120° + 90° + 50°) = 100° (The req.)

Answers of Test 4

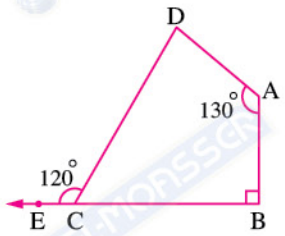
1 1 (d) 2 (c) 3 (c)

2 ∵ $E \in \overrightarrow{BC}$

∴ m (∠ DCB) = 180° – 120° = 60°

, ∵ the sum of the measures of the interior angles of the quadrilateral ABCD = 360°

∴ m (∠ D) = 360° – (60° + 90° + 130°) = 80° (The req.)



Answers of Test 5

1 1 (b) 2 (c) 3 (c)

2 ∵ $\overline{AE} \parallel \overline{BC}$, $\overleftrightarrow{AB}$ is a transversal to them.

∴ m (∠ A) + m (∠ B) = 180°

(Two interior angles in the same side of the transversal)

∴ m (∠ A) = 180° – 70° = 110°

, ∵ the sum of the measures of the interior angles of the pentagon ABCDE = 540°

∴ m (∠ E) = 540° – (70° + 150° + 80° + 110°) = 130° (The req.)

Prep [1] - Second Term - Algebra - Unit [1] : Numbers and Algebra

Lesson [1] : Repeated Multiplication

Generally

If $\frac{a}{b}$ is a rational number and n is a positive integer , then:

$\left(\frac{a}{b}\right)^n = \frac{a}{b} \times \frac{a}{b} \times \frac{a}{b}$ ... to n times

It is read as « $\frac{a}{b}$ to the power n » or «the n^{th} power of the number $\frac{a}{b}$ »

i.e. $\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}$

For example: • $\left(\frac{2}{5}\right)^3 = \frac{2^3}{5^3} = \frac{8}{125}$ • $(0.7)^2 = \left(\frac{7}{10}\right)^2 = \frac{7^2}{10^2} = \frac{49}{100}$

Remark

If $\frac{a}{b}$ is a rational number , then $\left(\frac{a}{b}\right)^0 = 1$ where $a \neq 0$

For example: • $\left(\frac{1}{5}\right)^0 = 1$ • $\left(-\frac{3}{7}\right)^0 = 1$

Remark

If a is a rational number and m is a positive integer , then :

$(-a)^m = (a)^m$ when m is an even number.

For example:

$\left(-\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^4 = \frac{1}{16}$

$(-a)^m = -(a)^m$ when m is an odd number.

For example:

$\left(-\frac{1}{2}\right)^3 = -\left(\frac{1}{2}\right)^3 = -\frac{1}{8}$

Lesson [2] : None Negative Integer Powers

The first law

Generally

If $\frac{a}{b}$ is a rational number , n and m are non-negative integers ,

then $\left(\frac{a}{b}\right)^n \times \left(\frac{a}{b}\right)^m = \left(\frac{a}{b}\right)^{n+m}$

i.e.

When multiplying the like bases , we add their powers (indices).

For example:

- $(\frac{2}{5})^3 \times (\frac{2}{5})^2 = (\frac{2}{5})^{3+2} = (\frac{2}{5})^5$
- $(-\frac{1}{2})^4 \times (-\frac{1}{2})^3 = (-\frac{1}{2})^{4+3} = (-\frac{1}{2})^7$

The second law

According to the first law , you know that : $a^6 = a^2 \times a^4$

, therefore : $a^6 \div a^2 = a^4$, $a^6 \div a^4 = a^2$

Generally

If $\frac{a}{b}$ is a rational number , where $\frac{a}{b} \neq 0$, n and m are non-negative integers , $n \geq m$,

then $(\frac{a}{b})^n \div (\frac{a}{b})^m = (\frac{a}{b})^{n-m}$

i.e.

When dividing like bases , we subtract their powers (indices)

For example:

- $(\frac{3}{8})^5 \div (\frac{3}{8})^2 = (\frac{3}{8})^{5-2} = (\frac{3}{8})^3$
- $(-\frac{2}{7})^4 \div (-\frac{2}{7})^2 = (-\frac{2}{7})^{4-2} = (-\frac{2}{7})^2$

The third law

You know that : $(a^2)^3 = a^2 \times a^2 \times a^2$, and according to the first law : $a^2 \times a^2 \times a^2 = a^6$

i.e. $(a^2)^3 = a^6$

Generally

If $\frac{a}{b}$ is a rational number , n and m are non-negative integers ,

then $[(\frac{a}{b})^n]^m = (\frac{a}{b})^{n \times m}$

For example:

- $[(\frac{3}{5})^3]^2 = (\frac{3}{5})^{3 \times 2} = (\frac{3}{5})^6$
- $[(-\frac{1}{2})^4]^2 = (-\frac{1}{2})^{4 \times 2} = (-\frac{1}{2})^8$

Lesson [3] : Negative Integer Powers

Definition :

If a is a rational number , $a \neq 0$ and n is a positive integer ,

then $\boxed{a^{-n} = \frac{1}{a^n}}$ and $\boxed{a^n = \frac{1}{a^{-n}}}$

For example:

- $3^{-3} = \frac{1}{3^3} = \frac{1}{27}$
- $3 \times 5^{-1} = 3 \times \frac{1}{5} = \frac{3}{5}$
- $\frac{2}{5^{-2}} = 2 \times 5^2 = 2 \times 25 = 50$
- $0.1 = \frac{1}{10} = 10^{-1}$, $0.01 = \frac{1}{100} = \frac{1}{10^2} = 10^{-2}$, ... and so on.

Remarks

1 If a is a rational number , $a \neq 0$ and n is a positive integer ,

then $a^n \times a^{-n} = a^n \times \frac{1}{a^n} = 1$ (the multiplicative neutral)

i.e. each of a^n and a^{-n} is the multiplicative inverse of the other

2 If $\frac{a}{b}$ is a rational number not equal to zero and n is a positive integer ,

then $\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$

For example: $\left(\frac{2}{3}\right)^{-2} = \left(\frac{3}{2}\right)^2 = \frac{9}{4}$

Remark

All laws of powers that we have studied in the previous lesson are correct in the case of the negative powers. So , the previous example can be solved by using laws of powers as follows :

1 $2^4 \times 2^{-2} = 2^{4+(-2)} = 2^2 = 4$

2 $\frac{5^{-2}}{5^{-3}} = 5^{-2-(-3)} = 5^{-2+3} = 5$

3 $(3^2)^{-2} = 3^{2 \times (-2)} = 3^{-4} = \frac{1}{3^4} = \frac{1}{81}$

4 $\frac{6^{-3} \times 6^5}{6^2} = 6^{-3+5-2} = 6^0 = 1$

5 $\left(\frac{5^3 \times 5^{-2}}{5^{-1} \times 5^4}\right)^{-2} = \left(5^{3+(-2)-(-1)-4}\right)^{-2} = \left(5^{3-2+1-4}\right)^{-2}$

$= \left(5^{-2}\right)^{-2} = 5^{(-2) \times (-2)} = 5^4 = 625$

6 $(7^3)^2 \times (7^{-2})^2 = (7^3 \times 7^{-2})^2$

$= \left(7^{3+(-2)}\right)^2 = 7^2 = 49$

Prep [1] - Second Term - Unit [3] : Geometry And Measurement

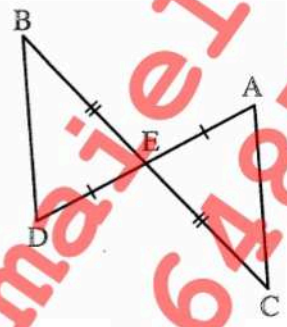
Lesson [1] : Deductive Proof

Example [1]

In the opposite figure :

$\overline{AD} \cap \overline{BC} = \{E\}$ where AE = DE and BE = CE

Prove that : $\Delta AEC \equiv \Delta DEB$



Solutions

Given $\overline{AD} \cap \overline{BC} = \{E\}$ where AE = DE , BE = CE

R.T.P. $\Delta AEC \equiv \Delta DEB$

Proof $\because \overline{AD} \cap \overline{BC} = \{E\}$ $\therefore m(\angle AEC) = m(\angle DEB)$ (V.O.A)

$\therefore$ In $\Delta\Delta$ AEC and DEB :

- AE = DE (given)
- CE = BE (given)
- $m(\angle AEC) = m(\angle DEB)$ (by proof)

$\therefore \Delta AEC \equiv \Delta DEB$ (Q.E.D.)

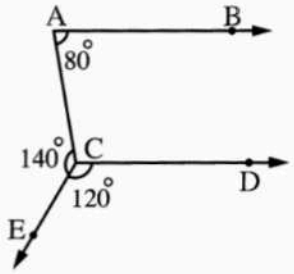
Example [2]

In the opposite figure :

$m(\angle BAC) = 80°$, $m(\angle DCE) = 120°$

and $m(\angle ACE) = 140°$

Prove that : $\overrightarrow{AB} // \overrightarrow{CD}$



Solutions

Given $m(\angle BAC) = 80°$, $m(\angle DCE) = 120°$,

$m(\angle ACE) = 140°$

R.T.P. $\overrightarrow{AB} // \overrightarrow{CD}$

Proof $\because m(\angle DCA) + m(\angle DCE) + m(\angle ACE) = 360°$

(accumulative angles at C)

$\therefore$ m ($\angle$ DCA) = 360° – (120° + 140°) = 100°

$\therefore$ m ($\angle$ BAC) + m ($\angle$ DCA) = 80° + 100° = 180°

And they are interior angles in the same side of the transversal $\overleftrightarrow{AC}$

$\therefore \overrightarrow{AB} // \overrightarrow{CD}$ (Q.E.D.)

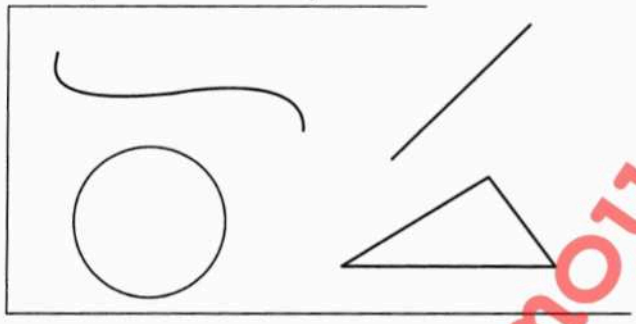
Lesson [2] : Part [1] : The Polygon

Before studying polygons we will study the types of the line as follows.

The simple line

It is the line that does not cut itself.

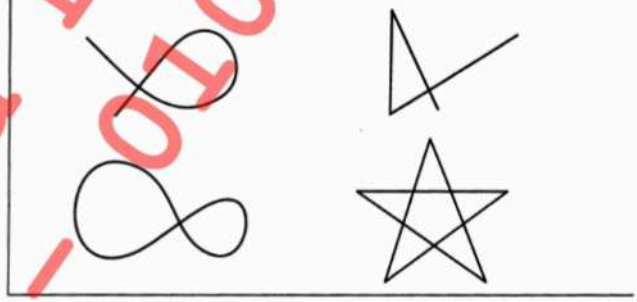
Examples for the simple line :



The non-simple line

It is the line that cuts itself once or more.

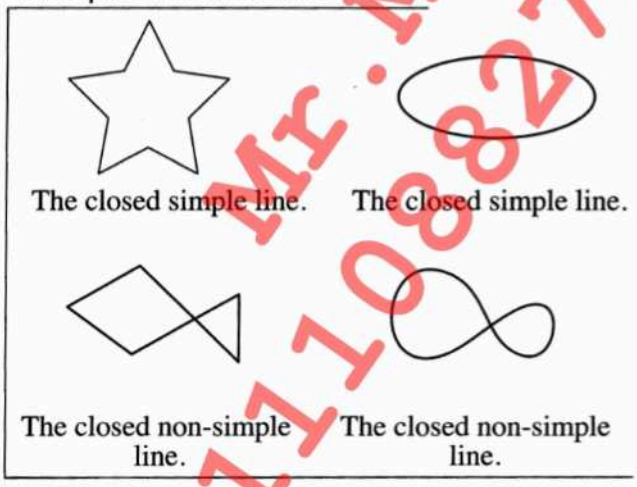
Examples for the non-simple line :



The closed line

It is the line that ends where it starts at the same point. It may be simple or non-simple.

Examples for the closed line :



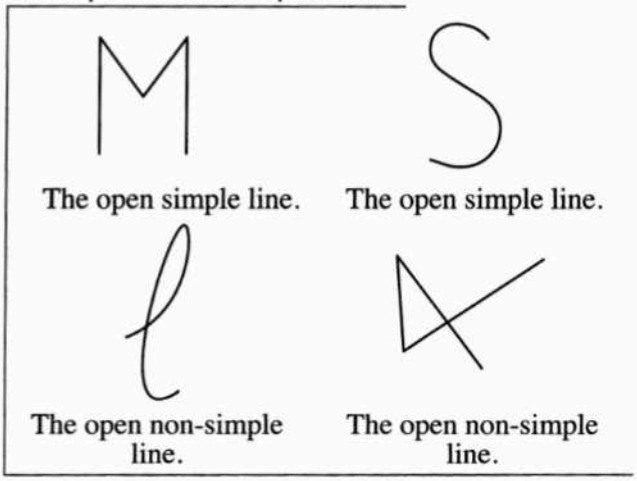
The closed simple line. The closed simple line.

The closed non-simple line. The closed non-simple line.

The open line

It is the line whose starting point is not the end point. It may be simple or non-simple.

Examples for the open line :



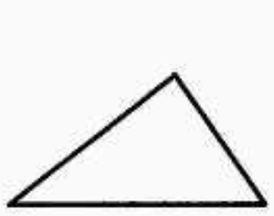
The open simple line. The open simple line.

The open non-simple line. The open non-simple line.

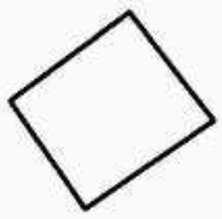
The Polygon :

It is a simple closed line that consists of three line segments , or more. The polygon is named according to the number of its sides.

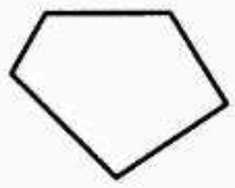
Examples for some polygons :



Triangle
(3 sides)



Quadrilateral
(4 sides)



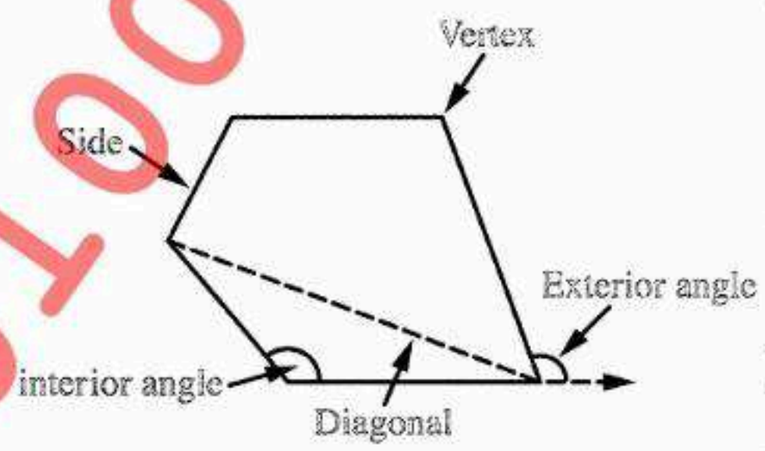
Pentagon
(5 sides)

Heptagon
(7 sides)

Octagon
(8 sides)

Remarks

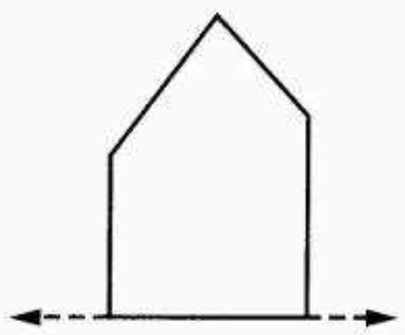
1. Each line segment of the line segments forming the polygon is called a side.
2. Each point resulted from intersecting of two adjacent sides of the polygon is called a vertex.
3. The sum of the side lengths of the polygon is called the perimeter of the polygon.
4. Each line segment joining two non-adjacent vertices of the polygon is called a diagonal of the polygon.
5. The included angle between two adjacent sides of the polygon is called an interior angle.
6. The included angle between a side of the polygon and the extension of its adjacent side is called an exterior angle.

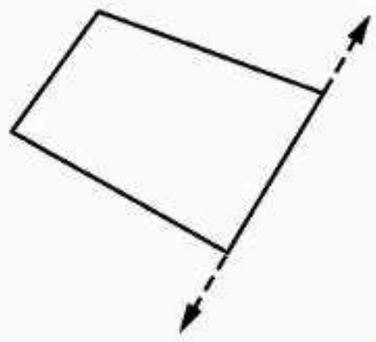


Convex Polygon And Concave Polygon :

In the convex polygon :

If a straight line is drawn to pass through any two consecutive vertices, then the remained vertices lie on one side of this straight line.



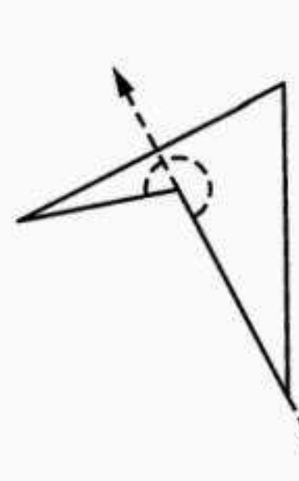


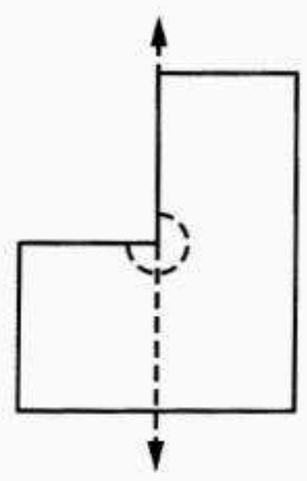
Notice that :

Any interior angle of the convex polygon has measure less than 180°

In the concave polygon :

There are straight lines (one at least) passing through two consecutive vertices and the remained vertices lie on two different sides of the straight line.





Notice that :

There is at least one interior angle of concave polygon of measure more than 180° (reflex angle).

The Sum Of Measures Of The Interior Angles Of The Polygon :

∴ The sum of measures of the interior angles of a polygon of n sides equals $(n - 2) \times 180°$

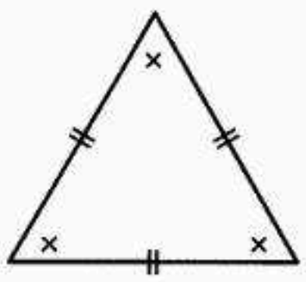
The sum of measures of the exterior angles of a convex polygon of n sides = 360°
(taking into account one exterior angle at each vertex)

The Regular Polygon :

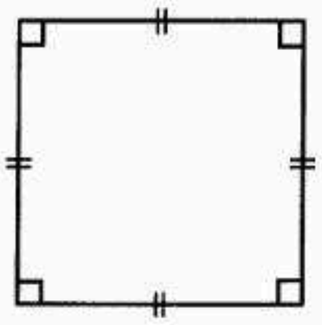
The polygon is regular if :

1. All its sides are equal in length.
2. All its angles are equal in measure.

As examples for the regular polygons :

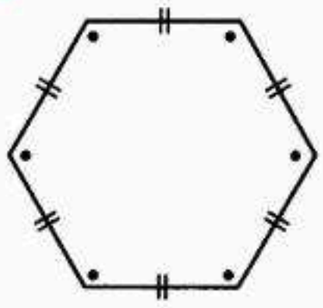


Equilateral triangle



Square

Regular pentagon



Regular hexagon

The Measure Of The Interior Angle Of A Regular Polygon :

∴ The measure of each interior angle of the regular polygon of n-sides $= \frac{(n - 2) \times 180°}{n}$

For example:

- The measure of each interior angle of the equilateral triangle $= \frac{(3 - 2) \times 180°}{3} = 60°$
- The measure of each interior angle of the square $= \frac{(4 - 2) \times 180°}{4} = 90°$
- The measure of each interior angle of the regular pentagon $= \frac{(5 - 2) \times 180°}{5} = 108°$
- The measure of each interior angle of the regular hexagon $= \frac{(6 - 2) \times 180°}{6} = 120°$

Notice that :

The number of the polygon sides = The number of its vertices
= The number of its interior angles = The number of its exterior angles

Remarks

The number of sides of the regular polygon in which the measure of one of its interior angles is $\chi° = \frac{360°}{180° - \chi}$

Number of diagonals = n (n – 3) ÷ 2

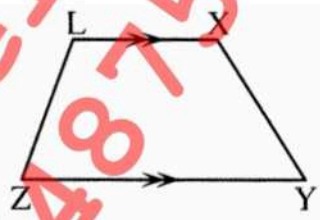
Lesson [2] : Part [2] : The Polygon

Trapezium – Parallelogram – Rectangle – Rhombus – Square

Trapezium :

A quadrilateral in which only two sides are parallel is called a trapezium , as shown in the opposite figure in which :

$\overline{XL} \parallel \overline{YZ}$



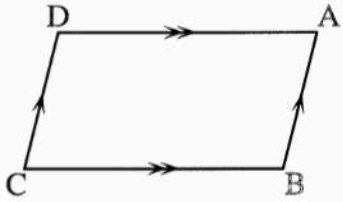
Definition

Parallelogram is a quadrilateral , in which each two opposite sides are parallel.

In the opposite figure

ABCD is a parallelogram because

$\overline{AB} \parallel \overline{DC}$ and $\overline{AD} \parallel \overline{BC}$



Properties of parallelogram :

1 Each two opposite sides are equal in length.		• AB = DC • AD = BC
2 Each two opposite angles are equal in measure.		• m (∠ A) = m (∠ C) • m (∠ B) = m (∠ D)
3 The sum of measures of each two consecutive angles is 180°		• m (∠ A) + m (∠ B) = 180° • m (∠ B) + m (∠ C) = 180° • m (∠ C) + m (∠ D) = 180° • m (∠ D) + m (∠ A) = 180°
4 The two diagonals bisect each other.		• AM = CM • BM = DM

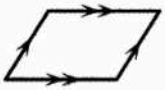
Remark [1]

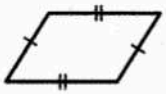
The perimeter of the parallelogram = The sum of two consecutive sides × 2

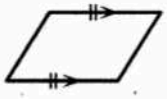
When does a quadrilateral represent a parallelogram ?

A quadrilateral represents a parallelogram if one of the following conditions satisfies

Each two opposite sides are parallel.	Each two opposite sides are equal in length.	Two opposite sides are parallel and equal in length.	Each two opposite angles are equal in measure.	The two diagonals bisect each other.
				

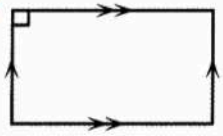






Rectangle :

Rectangle is a parallelogram with a right angle.



Properties Of Rectangle :

The rectangle has the same properties of the parallelogram and some additional properties as the following :

1 The four angles of the rectangle are all equal in measure and the measure of each is 90°		m (∠ A) = m (∠ B) = m (∠ C) = m (∠ D) = 90°
2 The two diagonals of the rectangle are equal in length.		AC = BD and as the two diagonals bisect each other , then AM = BM = CM = DM

Remark [2]

The perimeter of the rectangle = (length + width) × 2

Rhombus :

Rhombus is a parallelogram in which two adjacent sides are equal in length.

Properties Of Rhombus :

The rhombus has the same properties of the parallelogram and some additional properties as the following :

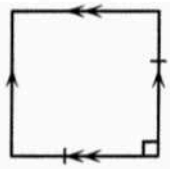
1 The four sides of the rhombus are all equal in length.		• AB = BC = CD = DA
2 The two diagonals of the rhombus are perpendicular and bisect each of its interior angles.		• $\overline{AC} \perp \overline{BD}$ • m (∠ 1) = m (∠ 2) = m (∠ 3) = m (∠ 4) • m (∠ 5) = m (∠ 6) = m (∠ 7) = m (∠ 8)

Remark [3]

The perimeter of the rhombus = the length of one side × 4

Square :

Square is a parallelogram with a right angle and two adjacent sides are equal in length.



Properties Of Square :

The square has the same properties of the parallelogram and some additional properties as the following :

1 Its four sides are all equal in length.		• AB = BC = CD = DA
2 Its four angles are all equal in measure and each of them is of measure 90°		• m (∠ A) = m (∠ B) = m (∠ C) = m (∠ D) = 90°
3 Its two diagonals are equal in length , perpendicular and each diagonal bisects the two vertices angles which this diagonal joins.		• AC = BD and hence AM = BM = CM = DM • $\overline{AC} \perp \overline{BD}$

Remark [4]

The perimeter of the square = the length of one side × 4

Notice That : -

We can also define the square as follows :

1. A square is a rectangle with two adjacent sides equal in length.
2. A square is a rectangle with two perpendicular diagonals.
3. A square is a rhombus with a right angle.
4. A square is a rhombus with two diagnals equal in length.

Notice That : -

To prove that the quadrilateral is a rectangle , a rhombus or a square , we must first prove that it is a parallelogram , as we see in the previous lesson , then :

The parallelogram is

a rectangle	a rhombus	a square
if :	**if :**	**if :**
One of its angles is a right angle	Two adjacent sides are equal in length.	One of its angles is right and two adjacent sides are equal in length.
or	**or**	**or**
Its two diagonals are equal in length.	Its two diagonals are perpendicular.	One of its angles is right and its two diagonals are perpendicular.
		or
		Its two diagonals are perpendicular and equal in length.
		or
		Two adjacent sides are equal in length and its two diagonals are equal in length.

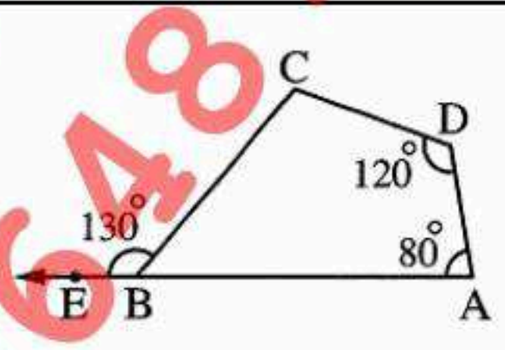
m (∠ A) = 80° , m (∠ D) = 120°

, m (∠ CBE) = 130°

Find : m (∠ C)



Model Exam (5) Question (5) (a)

Solutions

1 The sum = (6 – 2) × 180° = 720°

2 The measure of each interior angle = $\frac{(6-2)\times 180°}{6}$ = 120°

3 The number of sides = $\frac{360°}{180° - 120°}$ = 6 sides

4 The number of sides = $\frac{360°}{45°}$ = 8 sides

5 ∵ $\overrightarrow{DA} \cap \overrightarrow{FB} = \{C\}$

∴ m (∠ DCF) = m (∠ ACB) = 66° (V.O.A.)

From quadrilateral CDEF :

∴ m (∠ D) = 360° – (104° + 66° + 90°) = 100°

(The req.)

6 ∵ $\overline{AD} \parallel \overrightarrow{BC}$, $\overleftrightarrow{DC}$ is a transversal

∴ m (∠ DCE) = m (∠ ADC) = 110°

(alternate angles)

, ∵ $\overrightarrow{CF}$ bisects ∠ DCE

∴ m (∠ FCE) = $\frac{110°}{2}$ = 55°

, ∵ m (∠ B) = m (∠ FCE) = 55°

and they are corresponding angles.

∴ $\overline{AB} \parallel \overrightarrow{CF}$ (Q.E.D.)

7 ∵ $\overline{DC} \parallel \overline{AB}$, $\overleftrightarrow{AD}$ is a transversal

∴ m (∠ A) + m (∠ D) = 180°

(Two interior angles in the same side of the transversal).

∴ m (∠ A) = 180° – 127° = 53°

∴ m (∠ A) = m (∠ CBE) = 53°

and they are corresponding angles.

∴ $\overline{AD} \parallel \overline{BC}$ (Q.E.D.)

8 ∵ $\overline{AE} \parallel \overline{BC}$, $\overleftrightarrow{AB}$ is a transversal

∴ m (∠ A) + m (∠ B) = 180°

Two interior angles in the same side of the transversal.

∴ m (∠ B) = 180° – 80° = 100° (First req.)

From pantagon ABCDE :

∴ m (∠ D) = 540° – (120° + 80° + 100° + 140°)

= 100° (Second req.)

9 ∵ 2 χ = 720° – (110° + 90° + 165° + 115°) = 240°

∴ χ = 240° ÷ 2 = 120° (The req.)

10 ∵ B ∈ $\overrightarrow{AE}$

∴ m (∠ ABC) = 180° – 130° = 50°

∴ From the quadrilateral ABCD :

m (∠ C) = 360° – (50° + 80° + 120°)

= 360° – 250° = 110° (The req.)

The Answers:(2.Essay questions)

1 $\because m(\angle AMB) + (\angle CMD) + m(\angle DMA) + m(\angle CMB) = 360°$

$\therefore m(\angle AMB) + 40° + 60° + 120° = 360°$

$\therefore m(\angle AMB) = 360° - 220° = 140°$ (The req.)

---

2 $\because \overrightarrow{DE} // \overrightarrow{AB}$, $\overleftrightarrow{BD}$ is a transversal to them

$\therefore m(\angle B) = m(\angle EDB) = 60°$ (Alternate angles) (First req.)

, $\because \overrightarrow{BD} // \overrightarrow{AC}$, $\overleftrightarrow{AB}$ is a transversal to them.

$\therefore m(\angle A) + m(\angle B) = 180°$ (two interior angles in the same side of the transversal)

$\therefore m(\angle A) = 180° - 60° = 120°$ (Second req.)

---

3 $\because \overrightarrow{EF} // \overrightarrow{CD}$, $\overleftrightarrow{EC}$ is a transversal to them.

$\therefore m(\angle ECD) = m(\angle CEF) = 95°$ (Alternate angles)

$\therefore m(\angle ACD) = 95° - 30° = 65°$

$\therefore m(\angle ACD) + m(\angle A) = 65° + 115° = 180°$

and they are interior angles in the same side of the transversal

$\therefore \overrightarrow{AB} // \overrightarrow{CD}$, $\because \overrightarrow{CD} // \overrightarrow{EF}$

$\therefore \overrightarrow{AB} // \overrightarrow{EF}$ (The req.)

---

4 $\because \overrightarrow{AB} // \overrightarrow{CD}$, $\overleftrightarrow{AC}$ is a transversal to them

$\therefore m(\angle ACD) = m(\angle A) = 50°$ (Alternate angles)

, $\because m(\angle ACE) = 90°$

$\therefore m(\angle DCE) = 90° - 50° = 40°$

$\therefore m(\angle DCE) = m(\angle E)$ and they are alternate angles.

$\therefore \overrightarrow{CD} // \overrightarrow{EF}$ (The req.)

---

5 $\because \overrightarrow{AE} // \overrightarrow{BC}$, $\overleftrightarrow{AB}$ is a transversal to them.

$\therefore m(\angle A) + m(\angle B) = 180°$ (Two interior angles in the same side of the transversal)

$\therefore m(\angle A) = 180° - 70° = 110°$

, $\because$ the sum of the measures of the interior angles of the pentagon ABCDE = 540°

$\therefore m(\angle E) = 540° - (70° + 150° + 80° + 110°) = 130°$ (The req.)

---

6 $\because$ The sum of the measures of the interior angles of the quadrilateral ABCD = 360°

$\therefore 3x + 5x + 2x + 90° = 360°$

$\therefore 10x + 90° = 360°$

$\therefore 10x = 360° - 90° = 270°$

$\therefore x = \frac{270°}{10°} = 27°$ (The req.)

---

7 $\because$ The sum of the measures of the interior angles of the pentagon = 540°

$\therefore x + 2x + 2x + x + 2x = 540°$

$\therefore 8x = 540°$

$\therefore x = \frac{540°}{8} = 67.5°$ (The req.)

---

8 $\because$ The sum of the measures of the interior angles of the pentagon = 540°

$\therefore a + a + a + 90° + 90° = 540°$

$\therefore 3a + 180° = 540°$

$\therefore 3a = 540° - 180° = 360°$

$\therefore a = \frac{360°}{3} = 120°$ (The req.)

---

9 $\because E \in \overrightarrow{AB}$

$\therefore m(\angle ABC) = 180° - 130° = 50°$

, $\because$ the sum of the measures of the interior angles of the quadrilateral ABCD = 360°

$\therefore m(\angle C) = 360° - (50° + 80° + 120°) = 110°$ (The req.)

---

10 $\because \overrightarrow{DE} // \overrightarrow{BC}$, $\overleftrightarrow{AB}$ is a transversal to them

$\therefore m(\angle B) = m(\angle BAE) = 120°$ (Alternate angles)

, $\because m(\angle B) + m(\angle C) = 120° + 60° = 180°$

and they are interior angles in the same side of the transversal

$\therefore \overrightarrow{AB} // \overrightarrow{CD}$, $\because \overrightarrow{AD} // \overrightarrow{BC}$

$\therefore$ ABCD is a parallelogram. (Q.E.D.)

---

11 The perimeter of the parallelogram ABCD

$= (AB + BC) \times 2$

$= (5 + 8) \times 2 = 13 \times 2 = 26$ cm. (First req.)

$\because$ ABCD is a parallelogram

$\therefore m(\angle B) + m(\angle C) = 180°$

$\therefore m(\angle C) = 180° - 120° = 60°$ (Second req.)

12 $\because$ ABCD is a rhombus , $\overline{BD}$ is a diagonal

$\therefore$ m ($\angle$ ABC) = 2 m ($\angle$ ABD) = 2 × 62° = 124°

$\therefore$ m ($\angle$ A) = 180° − 124° = 56° (The req.)

---

13 In Δ ABE : m ($\angle$ B) = 180° − (45° + 70°) = 65°

, $\because$ m ($\angle$ D) + m ($\angle$ C) = 65° + 115° = 180°

and they are interior angles in the same side of the transversal

$\therefore$ $\overline{AD} \parallel \overline{BC}$ (1)

, $\because$ m ($\angle$ B) + m ($\angle$ C) = 65° + 115° = 180°

and they are interior angles in the same side of the transversal

$\therefore$ $\overline{AB} \parallel \overline{CD}$ (2)

, from (1) and (2) :

$\therefore$ ABCD is a parallelogram. (Q.E.D.)

$\therefore$ ABCD is a parallelogram. (Q.E.D.)

---

16 $\because$ $\overline{AD} \parallel \overline{BC}$ (Two opposite sides in the square)
